

Hello John,

I hope you're well, I'll sent you a list of steps to make your migration satisfactory.

First of all, you need an external drive that you have to make sure that it gave you enough capacity to store all the information you have in your data folder.

Second, connect this device to the USB port of your old computer.

Now when your computer recognizes the device, click on the file explorer and navigate to your data folder.

Then, select it and press the control + c keys at the same time.

Finally, using the file explorer, access your connected device and press at the same time, control + v key.

While the information is copied to your hard drive, you can have a cup of coffee.

After the information has been copied, you must disconnect the hard drive from your old computer, and connect it to your new laptop.

Now you must do the reverse process.

First, you connect the external hard drive to your new laptop.

Second, open the file explorer until you access the copy saved on your external drive.

Now you select the files, press the control + c keys and access the local hard drive of your laptop.

Then, you press the control + v keys and it starts copying from the external drive to your laptop.

And then, when everything is finished you'll have your files in three places: in your new laptop, in your external hard drive and in your old computer.

If you have any other questions, you can be sure i'll answer it.

Kind regards,

Rodolfo.
